

Derivations / Reasoning

Limitations of proofs by calculation

Proofs by calculation are formal and well-structured, but often **undirected** and **not** particularly **intuitive**.

Example

$$\begin{aligned} P \wedge (P \vee Q) &\stackrel{\text{val}}{=} (P \vee F) \wedge (P \vee Q) \\ &\stackrel{\text{val}}{=} P \vee (F \wedge Q) \\ &\stackrel{\text{val}}{=} P \vee F \\ &\stackrel{\text{val}}{=} P \end{aligned}$$

we can prove this more intuitively by reasoning

Conclusions

$$P \wedge (P \vee Q) \stackrel{\text{val}}{=} P \quad P \wedge (P \vee Q) \Leftrightarrow P \stackrel{\text{val}}{=} T$$

An example of a mathematical proof

Theorem

If x^2 is even, then x is even ($x \in \mathbb{Z}$).

(sub)goal

Proof

Let $x \in \mathbb{Z}$ be such that x^2 is even.

generating hypothesis

We need to prove that x is even too.

pure hypothesis

Assume that x is odd, towards a contradiction.

conclusion

If x is odd then $x = 2y+1$ for some $y \in \mathbb{Z}$.

Then $x^2 = (2y+1)^2 = 4y^2 + 4y + 1 = 2(2y^2 + 2y) + 1$
and $2y^2 + 2y \in \mathbb{Z}$.

So, x^2 is odd too, and we have a contradiction.

Thanks to Bas Luttik

Exposing logical structure

Theorem

If x^2 is even, then x is even ($x \in \mathbb{Z}$).

Proof

Let $x \in \mathbb{Z}$

Assume x^2 is even.

Assume that x is odd.

Then $x = 2y+1$ for some $y \in \mathbb{Z}$.

Then $x^2 = (2y+1)^2 = 4y^2 + 4y + 1 = 2(2y^2 + 2y) + 1$ and $2y^2 + 2y \in \mathbb{Z}$.

So, x^2 is odd

a contradiction.

So, x is even

(sub)goal

generating hypothesis

pure hypothesis

conclusion

Single inference rule

Q is a correct conclusion from n premises P_1, \dots, P_n
iff
 $(P_1 \wedge P_2 \wedge \dots \wedge P_n) \stackrel{\text{val}}{\models} Q$

If $n=0$, then $P_1 \wedge P_2 \wedge \dots \wedge P_n \stackrel{\text{val}}{=} T$

Note that $T \stackrel{\text{val}}{\models} Q$ means that $Q \stackrel{\text{val}}{=} T$

Q holds
unconditionally

Derivation

Q is a correct conclusion from n premises P_1, \dots, P_n
iff
 $(P_1 \wedge P_2 \wedge \dots \wedge P_n) \stackrel{\text{val}}{\models} Q$

a formal system
based on the single
inference rule
for proofs that closely
follow our
intuitive reasoning

Two types of inference rules:

elimination rules

for drawing
conclusions out of
premises

introduction rules

for simplifying goals

(particularly useful)
instances of the single
inference rule

and one new
special rule!

Conjunction elimination

How do we use a conjunction in a proof?

\wedge -elimination

Derivations / Reasoning with quantifiers

Proving a universal quantification

To prove

$$\forall x [x \in \mathbb{Z} \wedge x \geq 2 : x^2 - 2x \geq 0]$$

Proof

Let $x \in \mathbb{Z}$ be arbitrary and assume that $x \geq 2$.

Then, for this particular x , it holds that

$$x^2 - 2x = x(x-2) \geq 0 \quad (\text{Why?})$$

Conclusion: $\forall x [x \in \mathbb{Z} \wedge x \geq 2 : x^2 - 2x \geq 0]$.

\forall introduction

How do we prove a universal quantification?

similar to \Rightarrow -intro
with **generating hypothesis**

\forall -introduction

...

{Assume}

(k) **var** x; P(x)

...

(l-1) Q(x)
{ \forall -intro on (k) and (l-1)}

(l) $\forall x[P(x) : Q(x)]$

flag shows the validity of a hypothesis

Using a universal quantification

We know

$$\forall x [x \in \mathbb{Z} \wedge x \geq 2 : x^2 - 2x \geq 0]$$

Whenever we encounter an $a \in \mathbb{Z}$ such that $a \geq 2$,
we can conclude that $a^2 - 2a \geq 0$.

For example, $(52387^2 - 2 \cdot 52387) \geq 0$
since $52387 \in \mathbb{Z}$ and $52387 \geq 2$.

\forall elimination

How do we use a universal quantification in a proof?

similar to implication but we need a witness

\forall -elimination

|| |
(k) $\forall x[P(x) : Q(x)]$

|| |
(l) $P(a)$

|| |
{ \forall -elim on (k) and (l)}
(m) $Q(a)$

a is an object (variable, number,..) which is "known" in line (l)

the same "a" from line (l)

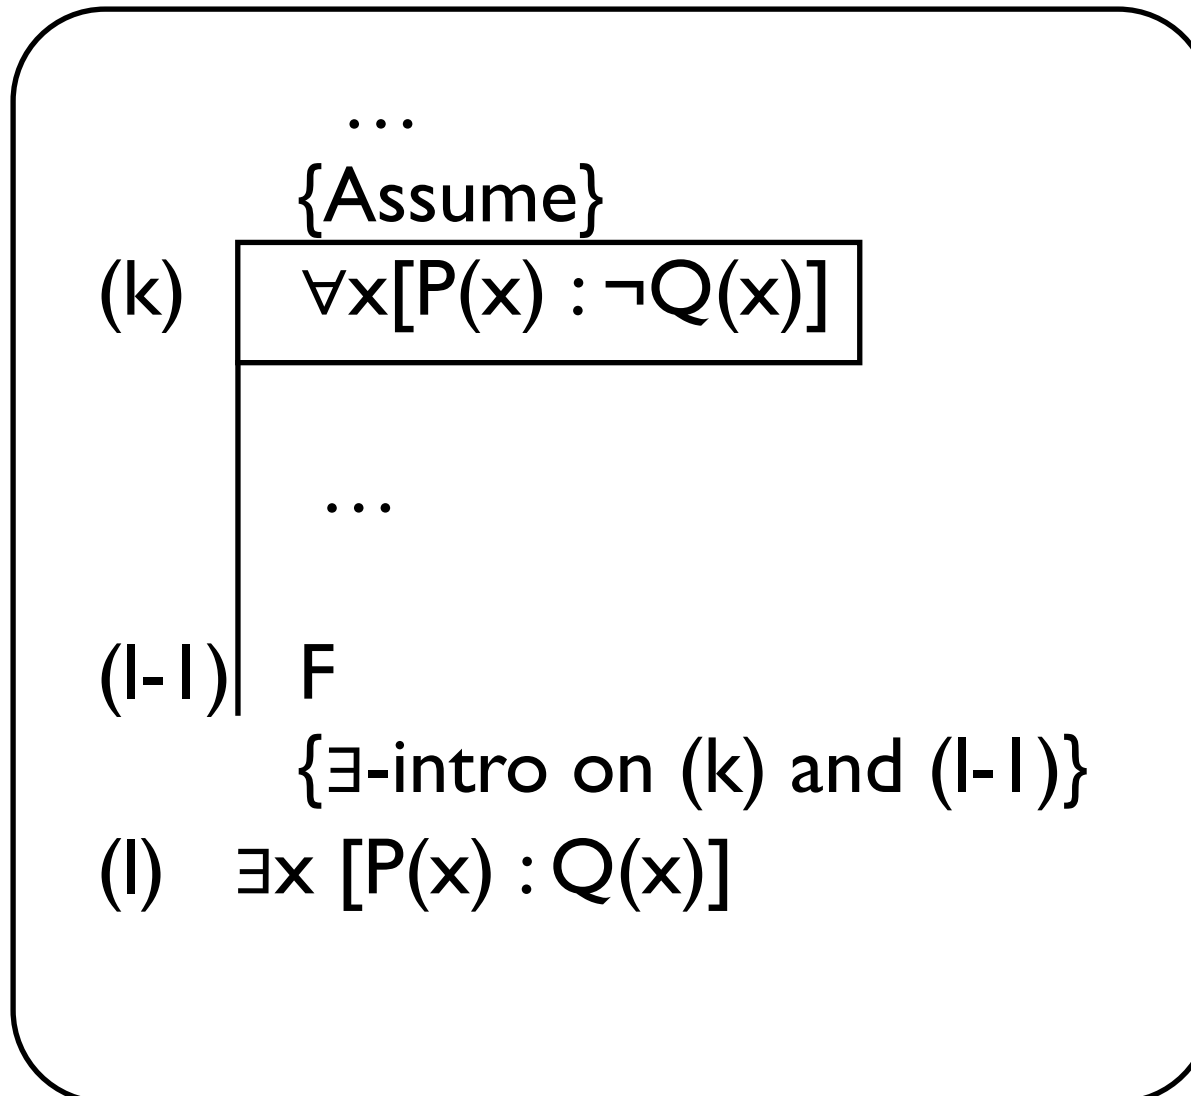

time for an example!

\exists introduction

How do we prove an existential quantification?

$$\neg \forall x [P(x) : \neg Q(x)] \stackrel{\text{val}}{\equiv} \exists x [P(x) : Q(x)]$$

\exists -introduction

and \neg -intro

\exists elimination

How do we use an existential quantification in a proof?

\exists -elimination

|| |
(k) $\exists x [P(x) : Q(x)]$
|| |
(l) $\forall x [P(x) : \neg Q(x)]$
|| |
{ \exists -elim on (k) and (l)}
(m) F

$\exists x [P(x) : Q(x)] \stackrel{val}{\models} \neg \forall x [P(x) : \neg Q(x)]$

and \neg -
elimination

time for an
example!

Proofs with \exists -introduction and \exists -elimination are unnecessarily long and cumbersome...

There are alternatives!

Proving an existential quantification

To prove

$$\exists x[x \in \mathbb{Z} : x^3 - 2x - 8 \geq 0]$$

Proof

It suffices to find a witness, i.e., an $x \in \mathbb{Z}$ satisfying
 $x^3 - 2x - 8 \geq 0$.

$x = 3$ is a witness, since $3 \in \mathbb{Z}$ and $3^3 - 2 \cdot 3 - 8 = 13 \geq 0$

Conclusion: $\exists x[x \in \mathbb{Z} : x^3 - 2x - 8 \geq 0]$.

also $x = 5$ is a witness...

Alternative \exists introduction

How do we prove an existential quantification?

by finding
a witness

\exists^* -introduction

...

(k) P(a)

...

(l) Q(a)

...

{ \exists^* -intro on (k) and (l)}

(m) $\exists x [P(x) : Q(x)]$

strategy: wait until a witness
object appears

does not
always work

Using an existential quantification

We know

$$\exists x[x \in \mathbb{R} : a - x < 0 < b - x]$$

We can declare an $x \in \mathbb{Z}$ (a witness) such that

$$a - x < 0 < b - x$$

and use it further in the proof. For example:

From $a - x < 0$, we get $a < x$.

From $b - x > 0$, we get $x < b$.

Hence, $a < b$.

Alternative \exists elimination

How do we use an existential quantification in a proof?

we pick a witness

\exists^* -elimination

|| |

(k) $\exists x [P(x) : Q(x)]$

|| |

{ \exists^* -elim on (k)}

(m) Pick x with P(x) and Q(x)

x must be new!

time for an example!
