

# Derivations / Reasoning

# Limitations of proofs by calculation

Proofs by calculation are formal and well-structured, but often **undirected** and **not** particularly **intuitive**.

## Example

$$\begin{aligned} P \wedge (P \vee Q) &\stackrel{\text{val}}{=} (P \vee F) \wedge (P \vee Q) \\ &\stackrel{\text{val}}{=} P \vee (F \wedge Q) \\ &\stackrel{\text{val}}{=} P \vee F \\ &\stackrel{\text{val}}{=} P \end{aligned}$$

# Limitations of proofs by calculation

Proofs by calculation are formal and well-structured, but often **undirected** and **not** particularly **intuitive**.

## Example

$$\begin{aligned} P \wedge (P \vee Q) &\stackrel{\text{val}}{=} (P \vee F) \wedge (P \vee Q) \\ &\stackrel{\text{val}}{=} P \vee (F \wedge Q) \\ &\stackrel{\text{val}}{=} P \vee F \\ &\stackrel{\text{val}}{=} P \end{aligned}$$

## Conclusions

$$P \wedge (P \vee Q) \stackrel{\text{val}}{=} P \quad P \wedge (P \vee Q) \Leftrightarrow P \stackrel{\text{val}}{=} T$$

# Limitations of proofs by calculation

Proofs by calculation are formal and well-structured, but often **undirected** and **not** particularly **intuitive**.

## Example

$$\begin{aligned} P \wedge (P \vee Q) &\stackrel{\text{val}}{=} (P \vee F) \wedge (P \vee Q) \\ &\stackrel{\text{val}}{=} P \vee (F \wedge Q) \\ &\stackrel{\text{val}}{=} P \vee F \\ &\stackrel{\text{val}}{=} P \end{aligned}$$

we can prove this more intuitively by reasoning

## Conclusions

$$P \wedge (P \vee Q) \stackrel{\text{val}}{=} P$$

$$P \wedge (P \vee Q) \Leftrightarrow P \stackrel{\text{val}}{=} T$$

# An example of a mathematical proof

## Theorem

If  $x^2$  is even, then  $x$  is even ( $x \in \mathbb{Z}$ ).

## Proof

Let  $x \in \mathbb{Z}$  be such that  $x^2$  is even.

We need to prove that  $x$  is even too.

Assume that  $x$  is odd, towards a contradiction.

If  $x$  is odd then  $x = 2y+1$  for some  $y \in \mathbb{Z}$ .

Then  $x^2 = (2y+1)^2 = 4y^2 + 4y + 1 = 2(2y^2 + 2y) + 1$   
and  $2y^2 + 2y \in \mathbb{Z}$ .

So,  $x^2$  is odd too, and we have a contradiction.

# An example of a mathematical proof

## Theorem

If  $x^2$  is even, then  $x$  is even ( $x \in \mathbb{Z}$ ).

(sub)goal

## Proof

Let  $x \in \mathbb{Z}$  be such that  $x^2$  is even.

We need to prove that  $x$  is even too.

Assume that  $x$  is odd, towards a contradiction.

If  $x$  is odd then  $x = 2y+1$  for some  $y \in \mathbb{Z}$ .

Then  $x^2 = (2y+1)^2 = 4y^2 + 4y + 1 = 2(2y^2 + 2y) + 1$   
and  $2y^2 + 2y \in \mathbb{Z}$ .

So,  $x^2$  is odd too, and we have a contradiction.

# An example of a mathematical proof

Theorem

If  $x^2$  is even, then  $x$  is even ( $x \in \mathbb{Z}$ ).

(sub)goal

Proof

Let  $x \in \mathbb{Z}$  be such that  $x^2$  is even.

generating hypothesis

We need to prove that  $x$  is even too.

Assume that  $x$  is odd, towards a contradiction.

If  $x$  is odd then  $x = 2y+1$  for some  $y \in \mathbb{Z}$ .

Then  $x^2 = (2y+1)^2 = 4y^2 + 4y + 1 = 2(2y^2 + 2y) + 1$   
and  $2y^2 + 2y \in \mathbb{Z}$ .

So,  $x^2$  is odd too, and we have a contradiction.

# An example of a mathematical proof

Theorem

If  $x^2$  is even, then  $x$  is even ( $x \in \mathbb{Z}$ ).

(sub)goal

Proof

Let  $x \in \mathbb{Z}$  be such that  $x^2$  is even.

generating hypothesis

We need to prove that  $x$  is even too.

pure hypothesis

Assume that  $x$  is odd, towards a contradiction.

If  $x$  is odd then  $x = 2y+1$  for some  $y \in \mathbb{Z}$ .

Then  $x^2 = (2y+1)^2 = 4y^2 + 4y + 1 = 2(2y^2 + 2y) + 1$   
and  $2y^2 + 2y \in \mathbb{Z}$ .

So,  $x^2$  is odd too, and we have a contradiction.

# An example of a mathematical proof

Theorem

If  $x^2$  is even, then  $x$  is even ( $x \in \mathbb{Z}$ ).

(sub)goal

Proof

Let  $x \in \mathbb{Z}$  be such that  $x^2$  is even.

generating hypothesis

We need to prove that  $x$  is even too.

pure hypothesis

Assume that  $x$  is odd, towards a contradiction.

conclusion

If  $x$  is odd then  $x = 2y+1$  for some  $y \in \mathbb{Z}$ .

Then  $x^2 = (2y+1)^2 = 4y^2 + 4y + 1 = 2(2y^2 + 2y) + 1$   
and  $2y^2 + 2y \in \mathbb{Z}$ .

So,  $x^2$  is odd too, and we have a contradiction.

# An example of a mathematical proof

Theorem

If  $x^2$  is even, then  $x$  is even ( $x \in \mathbb{Z}$ ).

# Derivations / Reasoning with quantifiers

# Proving a universal quantification

To prove

$$\forall x [x \in \mathbb{Z} \wedge x \geq 2 : x^2 - 2x \geq 0]$$

# Proving a universal quantification

To prove

$$\forall x [x \in \mathbb{Z} \wedge x \geq 2 : x^2 - 2x \geq 0]$$

Proof

Let  $x \in \mathbb{Z}$  be arbitrary and assume that  $x \geq 2$ .

Then, for this particular  $x$ , it holds that

$$x^2 - 2x = x(x-2) \geq 0 \quad (\text{Why?})$$

Conclusion:  $\forall x [x \in \mathbb{Z} \wedge x \geq 2 : x^2 - 2x \geq 0]$ .

# $\forall$ introduction

# Using a universal quantification

We know

$$\forall x [x \in \mathbb{Z} \wedge x \geq 2 : x^2 - 2x \geq 0]$$

# Using a universal quantification

We know

$$\forall x [x \in \mathbb{Z} \wedge x \geq 2 : x^2 - 2x \geq 0]$$

Whenever we encounter an  $a \in \mathbb{Z}$  such that  $a \geq 2$ ,  
we can conclude that  $a^2 - 2a \geq 0$ .

For example,  $(52387^2 - 2 \cdot 52387) \geq 0$   
since  $52387 \in \mathbb{Z}$  and  $52387 \geq 2$ .

Proofs with  $\exists$ -introduction and  $\exists$ -elimination are unnecessarily long and cumbersome...

There are alternatives!

# Proving an existential quantification

To prove

$$\exists x[x \in \mathbb{Z} : x^3 - 2x - 8 \geq 0]$$

# Proving an existential quantification

To prove

$$\exists x[x \in \mathbb{Z} : x^3 - 2x - 8 \geq 0]$$

Proof

It suffices to find a witness, i.e., an  $x \in \mathbb{Z}$  satisfying  
 $x^3 - 2x - 8 \geq 0$ .

$x = 3$  is a witness, since  $3 \in \mathbb{Z}$  and  $3^3 - 2 \cdot 3 - 8 = 13 \geq 0$

Conclusion:  $\exists x[x \in \mathbb{Z} : x^3 - 2x - 8 \geq 0]$ .

# Proving an existential quantification

To prove

$$\exists x[x \in \mathbb{Z} : x^3 - 2x - 8 \geq 0]$$

Proof

It suffices to find a witness, i.e., an  $x \in \mathbb{Z}$  satisfying  
 $x^3 - 2x - 8 \geq 0$ .

$x = 3$  is a witness, since  $3 \in \mathbb{Z}$  and  $3^3 - 2 \cdot 3 - 8 = 13 \geq 0$

Conclusion:  $\exists x[x \in \mathbb{Z} : x^3 - 2x - 8 \geq 0]$ .

also  $x = 5$  is a witness...

# Using an existential quantification

We know

$$\exists x[x \in \mathbb{R} : a - x < 0 < b - x]$$

# Using an existential quantification

We know

$$\exists x[x \in \mathbb{R} : a - x < 0 < b - x]$$

We can declare an  $x \in \mathbb{Z}$  (a witness) such that

$$a - x < 0 < b - x$$

and use it further in the proof. For example:

From  $a - x < 0$ , we get  $a < x$ .

From  $b - x > 0$ , we get  $x < b$ .

Hence,  $a < b$ .
